EO Application Package Best Practice
Pedro Gonçalves, Terradue

The 120th OGC Member Meeting
14 September 2021

The world’s leading and comprehensive community of experts making location information:

- Findable
- Accessible
- Interoperable
- Reusable
Members: please record your attendance

1. Find the appropriate project
2. Go to the Attendance tab
3. Add yourself to the session
• Previous OGC Testbeds 13-16 initiated the design of an application package for Earth Observation Applications in distributed Cloud Platforms

• The application package provides information about the software item, metadata and dependencies

• Deployed and executed within an Exploitation Platform in a service compliant with the OGC API Processes specification
• Evaluated the maturity of Application Package in a real world environment with applications brought by several developers that work with data from Earth observation satellites.

• These developers brought different views and requirements in terms of data access and processing to challenge the application package architecture and platform readiness.
The role of the Application Package

- Describes the data processing application by providing information about
  - parameters, software item, executable, dependencies and metadata.
- Ensures that the application is fully portable and supports automatic deployment in a Machine - To - Machine (M2M) scenario.
- Application Package information model allows the deployment of the application as OGC API - Processes compliant web service.
High Level Requirements

- Decouple application developers from exploitation platform operators and from application consumers
  - Focus on application development by minimizing platform specific particularities
  - Make their applications available on any number of platforms

- Enable exploitation platforms to virtually support any type of packaged EO application
EO Application Package

- Application developers create containers with their runtime environment, dependencies and application binaries.
- Application developers/integrators describe the Application package using the Common Workflow Language.
- Applications needing more complex Data Flow Management can use a local catalogue encoded using STAC as a data manifest for application inputs and outputs metadata.
- Application can be deployed in a Cloud provider and invocable in a service compliant with the OGC API Process specification.
EO Application Package Best Practices

- The application (e.g. Python, R, JAVA, shell script, C++) is containerized and register in Container Registry
- The application package is created in Common Workflow Language
- The application is deployed in an Exploitation Platform
- The service is available for execution with the OGC API Processes specification
- The Platform converts the OGC API Processes requests in a CWL execution request
Service Request from Clients (e.g. Portal)

Client (e.g. Portal)

Platform

Client (e.g. Portal)

OGC API Process
WPS
Service Request to Application Execution
Application Execution

Client (e.g. Portal) → Platform → Processing Cluster → Node → Containerized Application → Pod → Shared Storage Volume → Common Workflow Language

[Diagram showing the flow of application execution with various components and labels such as OGC logos, Google Cloud Platform, AWS, sobloo, HETZNER ONLINE, CREODIAS, ONDA, and EGI.]
OGC 20-089 defines guidance for the 3 viewpoints:

- **For a Developer** to adapt an application (or wrapper)
  - Optional data staging from a local STAC catalogue
  - Create and publish a Docker

- **For an Integrator** to package an application
  - Create the CWL document (command line, inputs, outputs … )

- **For an Platform** to deploy and execute the application
  - Extract the CWL Workflow information
  - Create the OGC API Processes Service Parameters mapped from the CWL
  - Expose the OGC API Processes service
• Document published in pending documents
  • https://portal.ogc.org/files/?artifact_id=98620

• Document source on OGC GitLab
  • opt-in 1st on the EOEP DWG page

https://gitlab.ogc.org/ogc/eoap-best-practice
Best Practice for EO Application Package

- Hands-on experience from Testbeds and Pilot
- Comments and suggestions tracked and resolved as GitLab Issues
- 11 submitters organisations (let's us know if you want to be added)
The EO Exploitation Platforms DWG recommends that the TC approve an electronic vote for releasing OGC 20-089 "Best Practice for EO Application Package" as a OGC Best Practice.

- Pending any final edits and review by OGC staff
- Motion: Günther (ESA)
- Second: Ryan (Geo COnnections)
- Discussion:
  - There was no objection to unanimous consent

This document defines the Best Practice to package and deploy Earth Observation Applications in an Exploitation Platform.
Looking forward hearing from you!

Backup Slides

- Usage Scenarios
- Common Workflow Language
- Data Staging with STAC
- Viewpoints explained
Usage Scenarios

Build to run operations from application testing, validation, and deployment to execution in production

- Alice to package an application
- Bob to script the execution of application
- Eric to deploy an application on platform Z
- Platform Z to accept the deployment of a new process
- Platform Z to execute a process with specific parameters
The CWL is a specification for describing analysis workflows and tools.

Portable and scalable across a variety of software and hardware environments, from workstations to cluster, cloud, and high performance computing (HPC) environments.

Design to meet the needs of data-intensive science, such as Bioinformatics, Medical Imaging, Astronomy, Physics, and Chemistry.
Application Package

Application developers

- Create containers with their runtime environment and dependencies
- Describe the overall package using the **Common Workflow Language (CWL)**.
The Platform stages-in the enclosures associated to the input references generating:

- a local STAC catalog for the fan-in pattern
- several local STAC catalogs with a single item for the fan-out pattern

The STAC catalog contains the items (product metadata) and assets (files with manifest and data (.xml, .jp2, tif, etc.))

The assets have an href relative path which resolves to the full path on the docker mounted volume by cwltool
STAC identifies any file that represents information captured in a certain space and time (spatiotemporal assets).

A STAC Item is a GeoJSON Feature with additional fields (e.g. time geo), links to related entities and assets (including thumbnails).

An asset is an object that contains a link to data associated with the Item that can be downloaded or streamed.
Data Flow Management

**Sentinel-2 fan-in**

```python
In [50]: s2_search.to_stac(**p)

```

```xml
• <Catalog id=catalog>
  • <Collection id=collection>
    • <EOItem id=S2A_MSI_L2A_20181229T095411_N0211_R079_T335WC_20181229T112231>

Out[46]: ['stac-catalog_0/catalog.json', 'stac-catalog_1/catalog.json', 'stac-catalog_2/catalog.json']
```
An **Application** needs to:

- Be executed as a command line application.
- Read a STAC local catalog as input manifest.
- Create a STAC local catalog as output manifest.
- Be executed in a docker container docker image.
An Application Package needs to:

- Be a valid CWL document with a single CWL Workflow Class and at least one Command Line Class
- Define the command line and respective parameters and container for each Command Line
- Define the Application parameters
- Define the requirements for runtime environment
A Platform needs to provide mechanisms to

- **deploy** the Application Package
- **execute** the process defined by the Application Package (i.e. creates a new job) with specific parameters
For the deployment, the platform needs to:

- Accept a Post request with an Application Package (OGC API - Processes)
- Translate Application Package metadata to add a process to a deployed OGC API - Processes server instance
- Translate Application Package Workflow Inputs defined in the CWL document as OGC API - Processes parameters
For the **execution**, the platform needs to:

- Translate OGC API - Processes execute parameters to the Workflow Inputs defined in the Application Package (CWL document)
For the **execution**, the platform needs to:

- Translate OGC API - Processes execute parameters to the Workflow Inputs defined in the Application Package (CWL document)
- If applicable, execute the data stage-in for the input EO products
- Orchestrate and execute CWL
- Translate output to OGC API process outputs
